INSPECTION SYSTEM

❖ Our Inspection System

Normally there are four stages of inspection:

- ❖ **Pre-production check:** this is done before production start, where there is a final verification of the material used, style, cut and workmanship of the garment or pre-production sample.
- ❖ **Initial production check:** this is done at the start of production where a first batch of garments is inspected, to distinguish possible discrepancies/variation and to allow for the necessary corrections to be made before bulk production. The inspection is a preliminary stage covering mainly style and general appearance, workmanship, measurements, quality of fabrics, components, weight, color and/or printing.
- ❖ **During production check:** this is done during production to ensure initial discrepancies/ variations have been rectified. This inspection is in fact the follow-up of the initial production check and is generally carried out a few days after the initial inspection, especially if discrepancies have been detected at that time.
- ❖ **Final random or full Q'ty inspection:** this is carried out when the production of the total quantity of an order or partial delivery is completed. A sample lot will be selected from the order and a percentage of the garments will be inspected, this percentage usually being stipulated by the buyer. The AQL sampling inspection may be applied or another inspection system designed by the buyer or according to customer's special request we conduct full q'ty inspection after whole process finished.
